

§6.2: Exponential Functions & Their Derivatives

Ch 6: Exponentials, Logs, & Inverse Trig Functions Math 5B: Calculus II

Dr. Jorge Eduardo Basilio

Department of Mathematics & Computer Science
Pasadena City College

Class Notes #1

February 19, 2019
Spring 2019

- 1 Guiding Questions
- 2 Basics of Exponential Functions
- 3 Derivatives of Exponential Functions
- 4 Eight Definitions of “ e ”
- 5 Derivative of the Natural Exponential Function
- 6 Integration of the Natural Exponential Function
- 7 Applications of Exponential Functions

Guiding Questions for §6.2

Guiding Question(s)

- 1 What **exponential functions**? Are they one-to-one? If so, what are their inverses?

Guiding Questions for §6.2

Guiding Question(s)

- ① What **exponential functions**? Are they one-to-one? If so, what are their inverses?
- ② Are exponential functions **differentiable**? If so, what is the derivative rule for computing their derivatives?

Guiding Questions for §6.2

Guiding Question(s)

- ① What **exponential functions**? Are they one-to-one? If so, what are their inverses?
- ② Are exponential functions **differentiable**? If so, what is the derivative rule for computing their derivatives?
- ③ What are some important **applications** of exponential functions?

Basics of Exponential Functions

Definition 1:

An **exponential function** is a function of the form:

$$f(x) = b^x \quad (1)$$

where b is a real number (briefly, $b \in \mathbb{R}$) satisfying

$$b > 0 \quad \text{and} \quad b \neq 1 \quad (2)$$

Graph on Desmos:

Example 1:

- $f(x) = 2^x$
- $f(x) = 5.89^x$
- $f(x) = \pi^x$

Example 2:

- $g(x) = \left(\frac{1}{2}\right)^x$
- $g(x) = 0.15^x$
- $g(x) = 3^{-x}$

Basics of Exponential Functions

But what does this mean??? $f(x) = b^x$

Using algebra we know:

Basics of Exponential Functions

But what does this mean??? $f(x) = b^x$

Using algebra we know:

- Integers: $x \in \mathbb{Z}$
 - $x = 0, 1, 2, 3, \dots$ repeated multiplication $b^3 = b \cdot b \cdot b$
 - $x = -1, -2, -3, \dots$ use exponent rules $b^{-3} = \frac{1}{b^3}$
- Fractions: $x \in \mathbb{Q}$
 - $x = p/q$ two steps $b^{p/q} = \left(\sqrt[q]{b}\right)^p = \sqrt[q]{b^p}$

Basics of Exponential Functions

But what does this mean??? $f(x) = b^x$

Using algebra we know:

- Integers: $x \in \mathbb{Z}$
 - $x = 0, 1, 2, 3, \dots$ repeated multiplication $b^3 = b \cdot b \cdot b$
 - $x = -1, -2, -3, \dots$ use exponent rules $b^{-3} = \frac{1}{b^3}$
- Fractions: $x \in \mathbb{Q}$
 - $x = p/q$ two steps $b^{p/q} = \left(\sqrt[q]{b}\right)^p = \sqrt[q]{b^p}$
- Rest of the Real Numbers: $x \in \mathbb{R}$?
 - How do we compute $2^{\sqrt{3}}$?

Basics of Exponential Functions

- To compute: $2^{\sqrt{3}}$
 - Since $\sqrt{3}$ is irrational, we can approximate it with rationals
 - Example: $1.732 = \frac{1732}{1000}$ so $2^{1.732} = 2^{\frac{1732}{1000}} = \sqrt[1000]{2^{1732}}$

$$1.73 < \sqrt{3} < 1.74 \quad \Rightarrow \quad 2^{1.73} < 2^{\sqrt{3}} < 2^{1.74}$$

$$1.732 < \sqrt{3} < 1.733 \quad \Rightarrow \quad 2^{1.732} < 2^{\sqrt{3}} < 2^{1.733}$$

$$1.7320 < \sqrt{3} < 1.7321 \quad \Rightarrow \quad 2^{1.7320} < 2^{\sqrt{3}} < 2^{1.7321}$$

$$1.73205 < \sqrt{3} < 1.73206 \quad \Rightarrow \quad 2^{1.73205} < 2^{\sqrt{3}} < 2^{1.73206}$$

$$\begin{array}{cccc} \vdots & \vdots & \vdots & \vdots \end{array}$$

- So we get a sequence of numbers that can be computed from above and below which “squeeze” the ideal value $2^{\sqrt{3}}$ **in the limit**.

Definition 2:

Using limits, we can define b^x rigorously using:

$$b^x = \lim_{r \rightarrow x} b^r \quad (3)$$

where $r \rightarrow x$ means “we choose a sequence of rational numbers r that approaches x .”

For more details, read the book carefully.

Basics of Exponential Functions

Case $b > 1$

Case $0 < b < 1$

Basics of Exponential Functions

We summarize some important properties of exponential functions:

Theorem 1: Properties of Exponential Functions

Let $f(x) = b^x$, with $b > 0$, $b \neq 1$.

- 1 f is continuous & one-to-one (hence, it's inverse exists!)
- 2 $D(f) = (-\infty, +\infty)$
- 3 $R(f) = (0, +\infty)$ (USEFUL!! $b^x > 0$ for all x)
- 4 the line $y = 0$ is a horizontal asymptote as $x \rightarrow -\infty$
- 5 Graphing Properties:

Case: $b > 1$

- increasing
- $\lim_{x \rightarrow -\infty} b^x = 0$
- $\lim_{x \rightarrow +\infty} b^x = +\infty$

Case: $0 < b < 1$

- decreasing
- $\lim_{x \rightarrow -\infty} b^x = +\infty$
- $\lim_{x \rightarrow +\infty} b^x = 0$

The exponential rules are also important:

Theorem 2: Laws of Exponents (or Exponent Rules)

Let $f(x) = b^x$, with $b > 0$, $b \neq 1$.

$$① \quad b^{x+y} = b^x \cdot b^y$$

$$② \quad b^{x-y} = \frac{b^x}{b^y}$$

$$③ \quad (b^x)^y = b^{xy}$$

$$④ \quad (ab)^x = a^x \cdot b^x$$

These can be rigorously proved using the limits theorems and Definition 7.

Basics of Exponential Functions

Activity 1:

- (a) Solve for x : $3^x = 0$
- (b) $\lim_{x \rightarrow \infty} (5^{-x} - 1)$
- (c) Sketch: $y = 3^{-x} + 1$

Derivatives of Exponential Functions

Let's compute the derivative of $f(x) = b^x$:

$$\frac{d}{dx} [b^x] =$$

Derivatives of Exponential Functions

With $f(x) = b^x$

$$\text{Notice: } f'(x) = f'(0)f(x)$$

This says:

rate of change of an exponential function is **PROPORTIONAL** to the function itself!

Geometrically:

The slope of an exponential function at a point P is **PROPORTIONAL** to the height of the point P (y -coordinate)

Derivatives of Exponential Functions

With $f(x) = b^x$:

$$\begin{aligned}\frac{d}{dx} [b^x] &= \lim_{h \rightarrow 0} \frac{b^{x+h} - b^x}{h} \\ &= b^x \lim_{h \rightarrow 0} \frac{b^h - 1}{h} \\ &= Cb^x\end{aligned}$$

where

$$C = \lim_{h \rightarrow 0} \frac{b^h - 1}{h}. \quad (4)$$

Now what? What is the value of C ? It is a constant that depends only on the base of the exponent b .

Eight Definitions of “e”

What is the value of C ? As we mentioned, it is a constant that depends only on the base of the exponent b .

- One answer is to just set this constant equal to 1 and find the base b that makes this true. That is, define **the number e** to be the the unique real number for which

$$1 = \lim_{h \rightarrow 0} \frac{e^h - 1}{h} \quad (5)$$

- We can interpret this **geometrically** as follows: we define **the number e** to be the the unique base of the exponential function whose tangent line has slope 1 at $x = 0$.

These are equivalent since the second definition says $f'(0) = 1$ which is equivalent to $\frac{d}{dx}[b^x]_{x=0} = Cb^0 = 1$ which is equivalent to $C = 1$ in (4), or (5)

Eight Definitions of “e”

$$1 = \lim_{h \rightarrow 0} \frac{e^h - 1}{h}$$

- It's really hard to figure out how to compute the value of e from this definition.
- There's many more ways we can define “e”
- Alternative definition: **Compound Interest** version 1:

$$e = \lim_{n \rightarrow +\infty} \left(1 + \frac{1}{n}\right)^n \quad (6)$$

- Alternative definition: **Compound Interest** version 2:

$$e = \lim_{h \rightarrow 0} (1 + h)^{1/h} \quad (7)$$

Eight Definitions of “e”

$$e = \lim_{n \rightarrow +\infty} \left(1 + \frac{1}{n}\right)^n \approx 2.7182818284590 \dots$$

- The **compound interest** (version 1) is the best formula for actually computing e .
- Notice how “slow” it is to get close to it's true value

n	$\left(1 + \frac{1}{n}\right)^n$
1	2
2	2.25
10	2.59374
20	2.65329
100	2.70481
1000	2.71692

Eight Definitions of “e”

- You promised us “eight definitions!”
- See my **hand-out**: “Eight Definiton of e ” on my website
- e is important so was discovered in many different ways
- First discovered in finance! Compound Interest

Derivative of the Natural Exponential Function

Definition 3:

The definition of e we'll assume is that e is the base of the exponential function that gives $C = 1$, i.e.

$$1 = \lim_{h \rightarrow 0} \frac{e^h - 1}{h}$$

The function $f(x) = e^x$ is called the **natural exponential function**.

Theorem 3: Derivative of the Natural Exponential Function

$$\frac{d}{dx} [e^x] = e^x \quad (8)$$

Formula (8) is one of my favorite formulas! It says: **the natural exponential function is its own derivative!**

Derivative of the Natural Exponential Function

Activity 2:

Find: $\lim_{x \rightarrow \infty} \frac{e^{2x}}{e^{2x} + 1}$

Derivative of the Natural Exponential Function

Activity 3:

Given that $y = e^{x^3}$, what is the equation of the tangent line at $P = (0, 1)$?

Derivative of the Natural Exponential Function

Activity 4:

If $y = e^{-4x} \sin(5x)$, what is y' ?

Derivative of the Natural Exponential Function

Activity 5:

What is the absolute maximum of $f(x) = xe^{-x}$?

Derivative of the Natural Exponential Function

Activity 6:

Use the “curve sketching information” (CSI Lines) of f' and f'' to sketch the graph of $f(x) = e^{1/x}$?

Integration of Natural Exponential Functions

Since e^x is its own derivative, it has an equally simple anti-derivative:
 $\int e^x dx = e^x + C.$

Theorem 4: Integration of Natural Exponential Functions

$$\int e^x dx = e^x + C \quad (9)$$

Integrals of the Natural Exponential Function

Activity 7:

(a) Evaluate: $\int x^2 e^{x^3} dx$

(b) Find the area under the curve $y = e^{-3x}$ from $x = 0$ to $x = 1$.

Applications of Exponential Function

There are so many applications of exponential functions that we'll study them in detail in §6.5. For now, we'll just list some of them:

- Population Growth and Decay
- Compound Interest in Finance
- Radioactive Carbon Dating
- And much, much more
