- 2 Introduction
- 3 Comparison Test
- 4 Limit Comparison Test

# Guiding Questions for §11.4

## Guiding Question(s)

- ① What is the **comparison test**?
- ② What is the **limit comparison test**?

- Finding the exact value (sum) of a general series is very difficult. We typically can only estimate the series with a partial sum,  $S_n$ .
- Still, we must know whether or not the series converges before we try to use the estimate (say, in solving an applied problem).
- Our goal in this section is to develop two more tools that helps us determine whether a series **converges** or **diverges**.
- The tools we learn in this section are called the **comparison test** and the **limit comparison test**.
- This question is so important that we will learn additional tools in future sections.

# Comparison Test

- We focus on series with **positive terms** only. I.e.  $a_n > 0$  (or non-negative  $a_n \geq 0$ )
- The basic idea of the comparison test is to use basic inequalities to compare with series we already know converge or diverge (so far: geometric series, harmonic series,  $p$ -series)
- We use the informal “squint test.”
- If the squint test suggest convergence, estimate with a series that's *known to converge that's larger*
- If the squint test suggest divergence, estimate with a series that's *known to diverge that's smaller*

# Comparison Test

- $\sum_{j=1}^{\infty} \frac{1}{2^j + 2^{j+1}}$  “squint test” should compare with  $\sum_{j=1}^{\infty} \frac{1}{2^j}$  (which converges by geometric series with  $r = 1/2$ )

$$\text{each term: } \frac{1}{2^j + 2^{j+1}} \leq \frac{1}{2^j}, \text{ for each } j = 1, 2, 3, \dots$$

- $\sum_{m=1}^{\infty} \frac{1}{4m-3}$  “squint test” should compare with  $\sum_{m=1}^{\infty} \frac{1}{m}$  (which diverges since harmonic)

$$\text{each term: } \frac{1}{4m-3} \geq \frac{1}{4m}, \text{ for each } j = 1, 2, 3, \dots$$

## Theorem 1: Comparison Test

Assume that  $a_n > 0$  and  $b_n > 0$ , i.e. the series  $\sum a_n$  and  $\sum b_n$  have **positive** terms.

- (a) If  $a_n \leq b_n$  for all  $n \geq 1$  and  $\sum b_n < \infty$  [C] THEN  $\sum a_n < \infty$  [C]
- (b) If  $b_n \leq a_n$  for all  $n \geq 1$  and  $\sum b_n = \infty$  [D] THEN  $\sum a_n = \infty$  [D]

**Remark:** the comparison test still works even if we ignore a finite number of terms. That is, if we know the comparison work *after ignoring a finite number of terms*,  $n \geq N$  (for some large  $N$ ).

## Activity 1:

Use the comparison test to determine whether  $\sum_{n=1}^{\infty} \frac{5}{2n^2 + 4n + 3}$  converges or diverges.

## Activity 2:

Use the comparison test to determine whether  $\sum_{n=1}^{\infty} \frac{\ln(n)}{n}$  converges or diverges.

*(Hint: ignore the first few terms then compare.)*

# Limit Comparison Test

- Hard to make comparisons with inequalities with series like:

$$\sum_{n=0}^{\infty} \frac{1}{3^n - 4} \quad \text{or} \quad \sum_{k=0}^{\infty} \frac{2k^3 - 5k - 3}{\sqrt{7 + k^8}}$$

- “Squint Test” says the first is like  $\sum \frac{1}{3^n}$  so should converge (geometric series with  $r = 1/3$ ) and the second is like  $\sum \frac{k^3}{k^{8/2}} = \sum \frac{1}{k}$  so should diverge (harmonic).
- The limit comparison test turns the squint test into a rigorous test!

## Theorem 2: Limit Comparison Test

Assume that  $a_n > 0$  and  $b_n > 0$ , i.e. the series  $\sum a_n$  and  $\sum b_n$  have **positive** terms. Define

$$L = \lim_{n \rightarrow \infty} \frac{a_n}{b_n}$$

If  $0 < L < \infty$ , THEN either both series converge, or both series diverge.

If  $L = 0$  or  $L = \infty$  then the test is inconclusive.

**Remark:** the limit comparison test still works even if we ignore a finite number of terms. That is, if the first few terms are negative, but are positive after then we can still use this test.

## Activity 3:

Use the limit comparison test to determine whether the series converges or diverges.

(a) 
$$\sum_{n=0}^{\infty} \frac{1}{3^n - 4}$$

(b) 
$$\sum_{k=0}^{\infty} \frac{2k^3 - 5k - 3}{\sqrt{7 + k^8}}$$
