Chapter 11: Inferences on Two Samples

Section 11.1: Inference about Two Population Proportions

# **Introduction Scenario:**

Think about whether you plan to vote in the next presidential election in 2020. Let's say I split the responses into two groups: Females and Males

Poll Q: variable

Notice: There are TWO proportions here:  $p_1 = \frac{8}{11} = 0$ , 727

$$p_2 = \frac{2}{3} = 0.667$$

**QUESTION:** Is there a statistically significant difference?

We don't care what the proportions actually are, we care about whether they're the SAME

\*\* In this section (11.1), we will only deal with independent samples with \_\_\_\_\_\_ Q valitative (61) variables.

### **Independent vs Dependent (Matched-Pairs) Samples**

sampling method is **independent** when an individual selected for one sample <u>DOE SN</u> t dictate which individual is to be in a second sample. S Mys F USA vs (anada

A sampling method is **dependent** when an individual selected to be in one sample is used to determine the individual in the second sample. Dependent samples are often referred to as **matched-pairs** samples. It is possible for an individual to be matched against him- or herself. same porson > Height Marical Couples

#### Ex 1: Independent vs Dependent samples

Scenario #1: Among competing acne medications, does one perform better than the other? To answer this question, researchers applied Medication A to one part of the subject's face and Medication B to a different part of the subject's face to determine the proportion of subjects whose acne cleared up for each medication. The part of the face that received Medication A was randomly determined. Matched Pair Sample - Dependent

Scenario #2: A researcher wishes to determine the effects of alcohol on people's reaction time to a stimulus. She randomly divides 100 people aged 21 or older into two groups. Group 1 is asked to drink 3 ounces of alcohol, while group 2 drinks a placebo. Both drinks taste the same, so the individuals in the study do not know which group they belong to. Thirty minutes after consuming the drink, the subjects in each group perform a series of tests meant to measure reaction Independent Samples time.

### The Logic

If  $p_1 = p_2$  then  $p_1 - p_2 = \underline{U}$ .

So we will first collect  $\underline{Simple\ random\ Sample\ S\ from\ }$  and find  $\underline{p}$  and  $\underline{p}$ 

Then we will see if  $\hat{p}_1 - \hat{p}_2$  is anywhere close to  $\bigcirc$ .

Recall the Logic: Say  $H_0: p_1 = p_2$  and  $H_A: p_1 < p_2$ . If we get...

• 
$$\hat{p}_1 = \hat{p}_2$$
 Fail to Reject  $H_0$  •  $\hat{p}_1 > \hat{p}_2$  Fail to Reject  $H_0$ 

•  $\hat{p}_1 < \hat{p}_2$  by "a little" Find to Reject  $H_0$  •  $\hat{p}_1 < \hat{p}_2$  by "a lot" then we Reject

### Hypothesis Test Regarding the Difference between Two Proportions $p_1$ and $p_2$ (Indep)

#### Step 0: Check Requirements

- The samples are simple random and <u>independent</u>
- At least five success  $n\hat{p} \ge 5$  and five failures  $|n\hat{q}| \ge 5$  for each sample.  $|n\hat{q}| \ge 5$

# **Step 1:** State Hypotheses

$$\begin{cases} H_0: p_1 = p_2 \\ H_A: p_1 \not \in p_2 \end{cases}$$

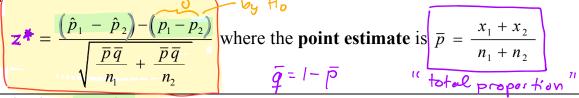

$$\begin{cases} H_0: p_1 = p_2 \\ H_A: p_1 \neq p_2 \end{cases}$$

$$\begin{cases} H_0: p_1 = p_2 \\ H_A: p_1 > p_2 \end{cases}$$

Step 2: Level of Significance

If it's not given, then use  $\underline{\hspace{1cm}}$ . Choice depends on seriousness of making Type  $\underline{\hspace{1cm}}$  error.

### Step 3: Test Statistic

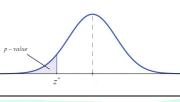

$$p = \frac{n_1 + n_2}{n_1 + n_2}$$

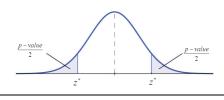

Step 4: Find a Critical Value or P-Value

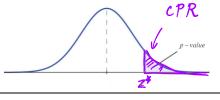

#### P-VALUE METHOD

#### **DECISION**

Decision { Reject  $H_0$  | if P-value  $\leq \alpha P$  is low  $\rightarrow M$  of Fail to Reject  $H_0$  | if P-value  $> \alpha P$  high  $\rightarrow M$  fly

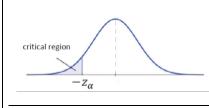

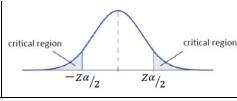

#### CRITICAL VALUE METHOD

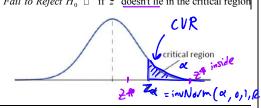

### **DECISION**

Decesion

Reject  $H_0$   $\square$  if  $z^*$  lies in the critical region Fail to Reject  $H_0 \square$  if  $z^*$  doesn't lie in the critical region

**Step 5:** Make a DECISION and write a CONCLUSION either rejecting or failing to reject  $H_0$ 

# GRAPHING CALCULATOR (TI-83 OR 84)

Instructions:

(a) STAT 
$$\Rightarrow$$
 TESTS  $\Rightarrow$  2-PropZTest

(b) Enter 
$$\begin{cases} x_1 / x_2 = \text{number of success in sample } \#1 / \#2 \\ n_1 / n_2 = \text{size of sample } \#1 / \#2 \\ p_1 \square \text{ alternative hypothesis} \end{cases}$$

$$z^{4} = \frac{(p_{1} - p_{2}) - (p_{1} - p_{2})}{\sqrt{p_{1}^{2} - p_{2}^{2} - (p_{1} - p_{2})}}$$

Test Statistic
$$\frac{4}{2} = \frac{(-1)^{2} - (-1)^{2}}{(-1)^{2} - (-1)^{2}} = \frac{(-1)^{2} - (-1)^{2}}{(-1)^{2} - (-1)^{$$

 $\bar{p} = \frac{53}{750} = 0.071$ 

P-value/Critical Region

$$P-Val = P(CPR)$$
  
= hormalcdf(-1=99,-2.51,0,1)

Decision about Null Hypothesis

11 There is enough statistical evidence to support the claim that the percentage the percentage of women ticketed is less than the percentage Conclusion of men ticketed.

Ex 3: In clinical trials of the anti-inflammatory drug Inflaminex, adult and adolescent allergy patients were randomly divided into two groups. Some patients received 500mcg of Inflaminex, while some patients received a placebo. Of the 2103 patients who received Inflaminex, 520 reported bloody noses as a side effect. Of the 1671 patients who received the placebo, 368 reported bloody noses as a side effect. Is there significant evidence Chim to conclude that the proportion of Inflaminex users who experienced bloody noses as a side effect is greater than who the proportion of the placebo group at the  $\alpha = 0.01$  level of significance? Use the Critical Value Method.

Check r<mark>equirem</mark>ents 6roup 2 N = 2103  $\begin{cases} H_0: P_1 = P_2 \\ H_A: P_1 > P_2 \text{ (Right Tailed Test)} \end{cases} P = \frac{x_1 + x_2}{h_1 + h_2} = \frac{520 + 368}{2103 + 1671} = 0.235$  $\frac{1}{2} = \frac{(\hat{P}_{1} - \hat{P}_{2}) - (\hat{P}_{1} - \hat{P}_{2})}{(\hat{P}_{1} - \hat{P}_{2})} = \frac{(0.147 - 0.210) - 1}{(0.235 + 0.765)} = 1.94$ 

P-value/Critical Region

1

Critical Value Za = Zo.o1 = inv Norm (0.01,0,1, Pight)  $\alpha = 0.01$   $\alpha = 0.01$   $\alpha = 0.01$ 

Decision about Null Hypothesis

Z=1.94 is OUTSIDE CVR b/c Z+ < Z2 1.94 < 2.37 so we Find to Reject Hol

Conclusion

"There is not enough statistical aidence to support the claim that the proportion of Inflaminex usess who experience bloody were is seater than the proportion of the placeto group at a level of significance of x=0.01.

#### CONFIDENCE INTERVAL FOR THE DIFFERENCE OF TWO POPULATION PROPORTIONS

 $(\hat{p}_1 - \hat{p}_2) - E < p_1 - p_2 < (\hat{p}_1 - \hat{p}_2) + E$ **Alternative Forms:** 

or 
$$(\hat{p}_1 - \hat{p}_2) \pm E$$

by 
$$E = z_{\alpha/2} \cdot \sqrt{\frac{\hat{p}_1 \hat{q}_1}{n_1} + \frac{\hat{p}_2 \hat{q}_2}{n_2}}$$

where the margin of error is given by  $E = z_{\alpha/2} \cdot \sqrt{\frac{\hat{p}_1 \hat{q}_1}{n_1} + \frac{\hat{p}_2 \hat{q}_2}{n_2}}$  Canyore where the margin of error is given by  $E = z_{\alpha/2} \cdot \sqrt{\frac{\hat{p}_1 \hat{q}_1}{n_1} + \frac{\hat{p}_2 \hat{q}_2}{n_2}}$  Graphing Calculator (TI-83 or 84) point 1 stimate: pi-p

**Instructions:** 

R

 $STAT \Rightarrow TESTS \Rightarrow 2-PropZInt$ (a)

(b) Enter 
$$\begin{cases} x_1 / x_2 = \text{number of successes in sample } \#1 / \#2 \\ n_1 / n_2 = \text{size of sample } \#1 / \#2 \\ C - level = \text{confidence level} \end{cases}$$

Ex 4: A study was conducted to test the effectiveness of a sweetener called xylitol in preventing ear infections in preschool children. In a randomized experiment, 159 preschool children took five daily doses of xylitol, and 46 of these children got an ear infection during the three months of the study. Meanwhile, 165 children took five daily doses of placebo syrup, and 68 of these children got an ear infection during the study. Construct a 90% confidence interval for the difference in the proportion of children that got ear infections for

the control group and the xylitol group.

P. - control grow pa: Xylito) rep

Find the point estimate (difference between sample proportions)
$$\hat{P}_{1} - \hat{P}_{2} = \frac{68}{155} - \frac{46}{159} = 0.123$$
pointert: 0.123

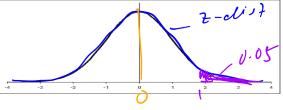

Pr = 68 Pr = 46

Determine critical value  $z_{\alpha/2}$ 

$$CL = 0.9$$
  
 $\alpha = 1-CL = 0.1$ 

R=0.412 R=0.289

Z2/2 = 20.05 = invNorm (0.05, 0, 1, R)

Find margin of error

$$E = \frac{1}{2} \frac{1}{2} \frac{1}{n_1} + \frac{1}{n_2} \frac{1}{n_1} + \frac{1}{n_2} \frac{1}{n_2} = 1.69 \frac{0.412(1-0.412)}{165} + \frac{0.289(1-0.289)}{159} = 0.0862$$

Construct confidence interval

Does it appear that the sweetener is effective at reducing ear infections? went P2 smaller than P1

popparameter: Pi-Pz >0 if xylital reduces ear infections. "We are 90% confident. the lives it is effective
